1. A method of reproducing an audio signal, comprising the steps of supplying an audio signal to a plurality of digital filters, respectively;

generating a sound field inside closed space by supplying respective outputs of the plurality of digital filters to a plurality of speakers constituting a speaker array, respectively; and

supplying the sounds outputted from the speaker array to a location of a listener inside the sound field after being reflected by a wall surface of the closed space with a sound pressure larger than that of a peripheral location by setting predetermined delay times for said plurality of digital filters, respectively.

2. The method of reproducing an audio signal according to claim 1, wherein

a sound pressure directly arriving at said listener from said speaker array is reduced by setting predetermined amplitudes to said plurality of digital filters, respectively.

3. An apparatus for reproducing an audio signal, comprising:
a plurality of speakers constituting a speaker array; and
a plurality of digital filters to which an audio signal is supplied, respectively,
wherein

a sound field is generated inside closed space by supplying respective outputs of said plurality of digital filters to said plurality of speakers, respectively; and

the sounds outputted from the speaker array are supplyed to a location of a listener inside the sound field after being reflected by a wall surface of the closed space with a sound pressure larger than that of a peripheral location by setting predetermined delay times for said plurality of digital filters, respectively.

4. The apparatus for reproducing an audio signal, according to claim 3, wherein

a sound pressure directly arriving at said listener from said speaker array is reduced by setting predetermined amplitudes to said plurality of digital filters, respectively.
